

Agentic AI Masterclass

Prerequisites — please complete before the session

Please do this at least the day before the session. Signing up for API keys can involve a short waiting period for account verification, and we won't have time to troubleshoot individual setups during class.

1 Install uv (Python package manager)

We'll use `uv` to install dependencies and run the project — it's faster and simpler than pip/venv.

macOS / Linux — open Terminal and run:

```
curl -LsSf https://astral.sh/uv/install.sh | sh
```

Windows — open PowerShell and run:

```
powershell -ExecutionPolicy Bypass -c "irm https://astral.sh/uv/install.ps1 | iex"
```

Full install docs (including other package managers like Homebrew, pipx, winget): docs.astral.sh/uv/getting-started/installation

Verify it worked by running `uv --version` in a new terminal window.

2 Set up a Tavily API key

Our agent uses Tavily to search the web — it has a free tier.

1. Go to app.tavily.com and sign up for a new account — you can sign up with a Google account.
2. Once logged in, check the dashboard: if an API key is already listed there by default, you can leave it as is and use it.
3. If no key exists, create a new one.
4. Copy the key and save it somewhere safe (a notes app or password manager) — you'll paste it into a `.env` file during the session.

3 Set up a Discord webhook

Our agent will post its results to a Discord channel via a webhook.

1. Go to discord.com and sign up, or log in if you already have an account.
2. Create a new server (or use an existing one), then create a new text channel inside it — or you can reuse the default `#general` channel.
3. Open that channel's **Settings** (the gear icon next to the channel name).

4. Go to **Integrations** → **Webhooks**.
5. Click **New Webhook**, then click **Copy Webhook URL**.
6. Save that URL somewhere safe — treat it like a password. Anyone with the URL can post messages to your channel.

4 Set up a Google Gemini API key

Our agent uses Google's Gemini model, which also has a free tier.

1. Go to aistudio.google.com/apikey and sign in with a Google account.
2. Click **Create API key**. If it asks you to select a Google Cloud project, click **Create new project**, name it `agent-ai`, then select that project to create the API key.
3. Copy the key and save it alongside your Tavily and Discord credentials from steps 2 and 3.

Checklist — before the session, you should have:

- ☐ `uv --version` runs successfully in your terminal
- ☐ A Tavily API key saved
- ☐ A Discord webhook URL saved
- ☐ A Google Gemini API key saved

See you at the session — bring a laptop with these ready to go.
